

A

Representative raw-event hierarchy: 4N-A8-RR

4N origin; 120 mg/kg; workspace-defined per-sample coordinates

Scatter display: up to 10,000 evenly spaced events; counts use every event

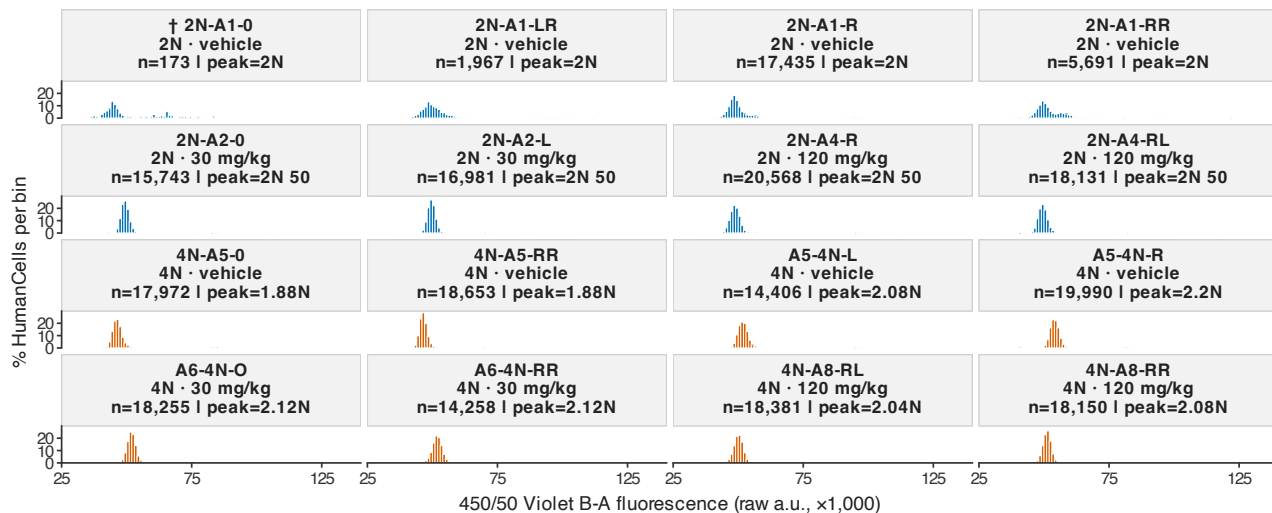

B

Within-mouse-normalized DNA-content distributions

Replayed HumanCells use identical 1,000-a.u. bins and one raw fluorescence window; only y is normalized within mouse.

Each facet reports its reviewed FlowJo peak annotation.

† 2N-A1-0 was retained but flagged: 174 frozen FlowJo HumanCells (173 by replay).

Human Cell Enrichment and HumanCells are workspace population names; no explicit singlet or viability gate is present.

The eight 4N-origin reviewed peak annotations span 1.88N–2.20N and are printed in their Panel B facets.

Peak-gate names are analyst-supplied FlowJo annotations, not newly calibrated or NUMBAT-equivalent ploidy estimates.
