

High-ploidy-selective enrichment, clustered rows and columns

Heatmap visualization showing high-ploidy-selective enrichment across 20 cancer types (rows) and 20 drug classes (columns). The color scale represents $-\log_{10}(\text{enrichment p-value})$, ranging from 0.0 (dark purple) to 2.0 (yellow). Asterisks (*) indicate significant enrichment.

Cancer Types (Rows): LAML, NB, DLBC, LGG, LUAD, ESCA, PAAD, SCLC, OV, allcancers, HNSC, KIRC, ALL, LUSC, GBM, COREAD, THCA, BRCA, MM, BLCA, UNCLASSIFIED, LIHC, STAD, SKCM.

Drug Classes (Columns): Ser/Thr kinase inhibitors, Epigenetic inhibitors, Receptor tyrosine kinase inhibitors, Metabolic/redox agents, Antimitotic agents, Non-receptor tyrosine kinase inhibitors, Hedgehog pathway inhibitors, Proapoptotic agents, p53/MDM2 pathway, Tumor antibiotics, Hormone therapy, WNT-pathway modulators, Proteasome inhibitors, Topoisomerase inhibitors, Chaperone/protein homeostasis inhibitors, DNA damage repair inhibitors, Antimetabolites, Other, Alkylating agents.

Key observations: Significant enrichment (yellow/green) is observed for several drug classes across multiple cancer types, including Ser/Thr kinase inhibitors, Epigenetic inhibitors, Receptor tyrosine kinase inhibitors, Metabolic/redox agents, Antimitotic agents, Non-receptor tyrosine kinase inhibitors, Hedgehog pathway inhibitors, Proapoptotic agents, p53/MDM2 pathway, Tumor antibiotics, Hormone therapy, WNT-pathway modulators, Proteasome inhibitors, Topoisomerase inhibitors, Chaperone/protein homeostasis inhibitors, DNA damage repair inhibitors, Antimetabolites, Other, and Alkylating agents.
