

A

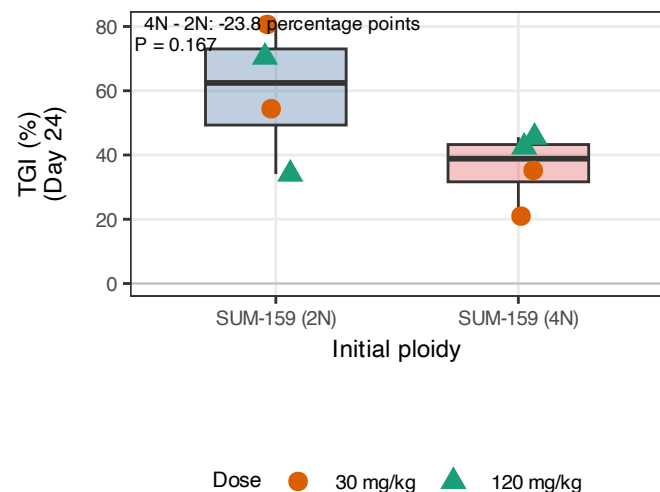

At each marked endpoint:
 $TGI = 100 \times (1 - \text{treated growth delta} / \text{mean injected-origin-matched control growth delta})$

Thin lines: individual mice. Dashed black: mean injected-origin-matched untreated controls.
Red dashed: Day 24; red solid: Day 31.

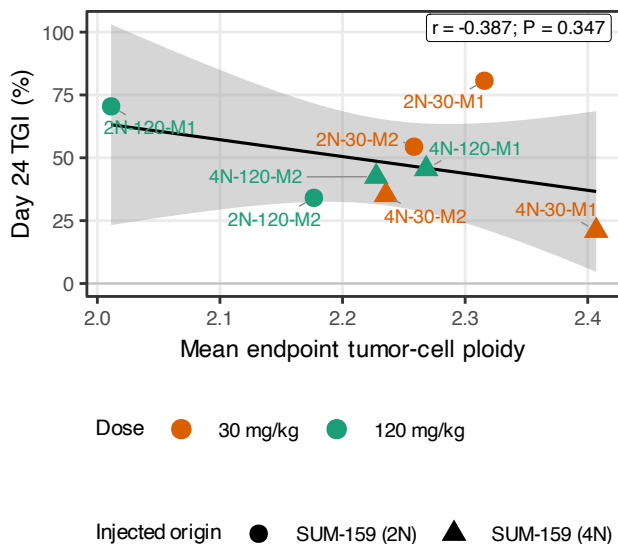

B

Day 24 TGI by
initial ploidy

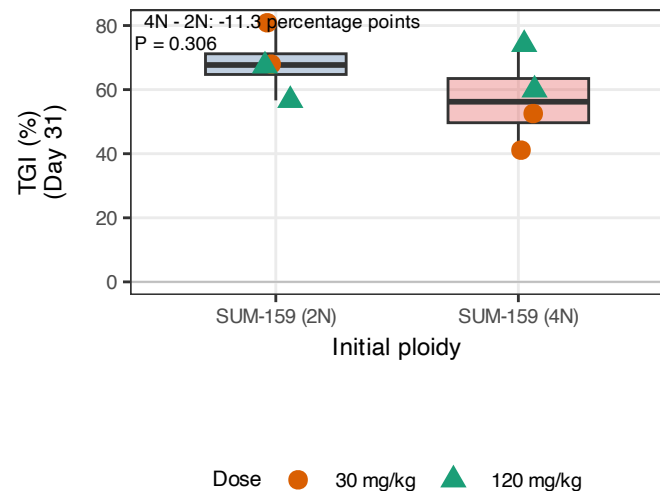

**C**

Day 24 TGI vs endpoint
tumor-cell ploidy

5,335 QC-passed treated-tumor CBS cells;
unadjusted mouse-level association

**D**

Day 31 TGI by
initial ploidy

**E**

Day 31 TGI vs endpoint
tumor-cell ploidy

5,335 QC-passed treated-tumor CBS cells;
unadjusted mouse-level association
